5-MINUTE GUIDE DEMO

Show your guide the whole project quickly and confidently

PART A - Show the Live Dashboard (2 min)

STEP 1: Open a terminal, go to project folder, start dashboard

Say: "Sir/Ma'am, this is our Smart Surveillance Web Dashboard. It streams the live camera feed into a browser in real time."

STEP 2: Open browser at http://localhost:5000

Say: "Watch - the camera feed is live. As anyone comes in front of the camera, the system draws boxes around their face."

PART B - Show Face Detection + Recognition (1.5 min)

STEP 1: Point webcam at yourself / guidance

Say: "A GREEN box means an unknown person. Now watch - when a face matches our registered database, the box turns RED and shows the person's name and confidence %."

STEP 2: If ujjeef face is shown (photo/another person).

Say: "Here it found a match with 90% confidence. The system just saved a snapshot and logged this detection into the database."

PART C - Show Object Detection (YOLO) (1 min)

STEP 1: Hold an object in view (bag/person/bottle)

Say: "The BLUE boxes are objects detected by YOLO - a deep learning model trained on 80 classes. It detects people, bags, phones, and more in every frame."

STEP 2: Show a bag/backpack

Say: "Suspicious objects like bags and backpacks are drawn in RED with a warning, because in a surveillance context they need attention."

PART D - Show Alerts + Email (0.5 min)

STEP 1: Click the Alerts page in the top bar

Say: "Every detection is recorded here - time, name, confidence, camera, and if it was a match. This is audit-ready evidence."

STEP 2: Mention email system

Say: "When a registered person is detected, the system instantly emails a snapshot to the authority with time and camera location."

BACKUP KEY POINTS (if they ask details)

Q: How do you detect faces?

A: Haar Cascade in OpenCV - a pre-trained face finder.

Q: How do you identify WHO a person is?

A: We convert each face into a 128-number embedding with dlib, then compare with a database using Euclidean distance. Low distance = same person.

Q: What is YOLO doing?

A: YOLO is a single-pass CNN detecting 80 object classes. We run it through OpenCV's DNN module.

Q: What happens on a match?

A: Snapshot saved + email sent via SMTP + logged to SQLite/CSV with timestamp and camera ID.

Q: Where is data stored?

A: SQLite database (logs/faces.db) plus CSV logs.

Q: Is it real-time?

A: Yes - the camera thread runs continuously and the dashboard streams it.

Remember: stay calm, let the camera do the talking.
